Thursday, January 11th, 2018

Opportunity

- Brain is a huge unknown
- Source of many incurable diseases
- Neurological disorders rising
- Learning more about brain may determine the cause of these diseases

10 Challenges: A Summary

1. Structure does not equate to function
 - a. Primary question of connectomics
 - b. Connectomics complements physiology
2. Brain is not a perfect map
 - a. Not the point of connectomics
3. Connectomics is pointless/not worth it
 - a. There is value, progress is growing exponentially

Actions

- Graph Theory
 - Pattern recognizing in large graphs
- Computer Vision
 - Brain image segmentation
- Faster data collection
 - More cheaper experiments

Resolutions

Pursue connectomics!

1. Must map whole brain to get every synapse
2. Cannot “black box” the brain
3. We will learn a lot from mapping the brain

Feedback

- Good argument by contradiction
- Accessible introduction
- Easy read (6 pgs)
- Could be more technical
- Excited to learn in detail about the actions the paper outlines

Thank You!
